Client Meeting - January 14th, 11:30 - 11:45 am PST

Team updates for the client:

- Hosting: we plan on deploying the app as a PWA using Firebase
- Database: we will implement our database with PHP and MySQL, with Google Cloud being a good option to administer the database once testing is complete. We will also look into solutions later on to implement 2 databases (1 local, 1 remote) so that the application functions offline
- Article editor: we will be using an RTE component for Angular so our text editor is more user-friendly.

Client updates and questions:

- How long will it take to implement the RTE?
- More updates on how the eco tracker calculations will be posted later in Discord.
- The client reminded us that there are additional features they want to implement in term 2. More updates on this will be discussed next week.
